

SUPPORTING ENHANCED MEDIA COMMUNICATIONS
IN COMMUNICATIONS CONFERENCES

ABSTRACT OF THE DISCLOSURE

5 A method for supporting communications involves establishing a communications conference that includes multiple conference participants that each provide an audio stream. Audio data packets in the audio streams are identified, and audio information from selected audio data packets is mixed to generate a conference audio stream that is communicated to the conference participants. Enhanced media packets in at least one of the audio streams are identified, and the enhanced media packets are communicated to selected conference participants.
